

Open Space Sub Area

Client – Basic Remediation Company

Owner - TIMET

Conduct soil sampling program as per direction of BRC at up to 112 locations referred to in the Sampling and Analysis Plan. Up to three (3) sample depths will be collected at most locations identified by the SAP. Two borings will be drilled to groundwater and sampled/analyzed for physical parameters just above the groundwater in the capillary fringe. Two borings will be sampled for SPLP testing. Drill rig assisted sampling techniques and field documentation will be provided. Services are on a time and materials basis not to exceed without further authorization.

Locate and stake 112 borings and collect subsurface samples at locations and depths specified in the SAP. Soil samples will be collected at up to 3 sample depth intervals per location. Document drilling and sampling, maintain chain-of-custody and prepare boring logs. Ship samples by Fedex priority overnight using the BRC shipping account # for GEL lab and the Test America shipping account # for TA lab. Prepare a Field Activity Report following completion of the field work.
