

Sunset North Commercial Sub-Area Soil Sampling

Client – Basic Remediation Company

Owner – Basic Remediation Company

Located and collected soil samples for asbestos analysis from 50 surface and subsurface locations. Staking locations occurred concurrently with asbestos sampling and performing a USA underground utility clearance. The sample sites were located using a Trimble GPS Unit. The sample locations were based on GPS coordinates provided by ERM. Following the USA utility clearance, 50 boring locations were drilled and sampled per instructions from Dr. Ranajit Sahu at BRC.

The sample locations were photographed before collecting the samples. Judgmental sample locations were not sampled when they were originally staked.
